

Assembly plugs for hydraulic tubes

For sealing during maintenance work

The range of tubes and pipes of the High Pressure Connectors Europe, known on the market under the brand name "Ermeto", is now rounded off by the range of assembly plugs.

When performing maintenance work on hydraulic lines, the oil is first drained. However, more and more oil residues flow out of the lines during dismantling. The escaping oil not only contaminates the system but also the work tools and can possibly damage health. The assembly plugs have now been introduced provide a remedy here.

The assembly plug keeps your work areas free from leaking oils, chemicals and other liquids and thus protects people and environment. The high-quality, durable elastomer mixture made of TPE (55° Shore) is resistant and can be used in a temperature range from -50°C to +120°C.

The product series completes the range for this market and once again demonstrates Parker's competence and reliability as a system supplier. All this means more safety and performance for our customers.
